TRUMPF energy policy

TRUMPF is a leading global technology company. We offer our customers high quality solutions for their work in the form of innovative products. Our striving to achieve outstanding results in our products and processes has also spread into the area of energy and resource use.

The following principles form the framework of energy management at TRUMPF:

Reducing energy consumption on a long-term basis

We use energy economically and will continually improve our energy efficiency. In doing so, we want to reduce our CO₂ emissions. The systematic collection and analysis of energy data assists us in the setting of sensible priorities.

Using efficient technology

We review the energy efficiency of our products, production processes and infrastructure on a regular basis. Processes, systems and buildings correspond to the state of the art. This is something that we give attention to when reorganizing buildings or constructing new ones and also when procuring our operating equipment.

Making employees aware and involving them

A successful energy management requires staff of all company levels who are aware of their responsibilities to cooperate in both deed and thought for the realizing of these principles. We support them in this through basic and further education.

Improving continually

To achieve our goals, we are launching an energy management system based on ISO 50001, starting with a focus on the TRUMPF manufacturing sites in Europe. We are also creating the necessary financial and structural conditions for this. The management system is regularly assessed and improved. We also comply with the legal and other requirements for the implementation of an energy management system.

Ditzingen, 2015-09-01
